Behavioral Health measures are structured to track screenings for patients with serious mental illness conditions of bipolar disorder, schizophrenia, and depression. Each measure has specific requirements available for review in the Appendix.

Performance displays three categories of calculation.

Met - The patient has fallen into both the numerator and denominator requirements including any office visit criteria.

Not Met - The patient meets the denominator criteria and has eligible office visits during the measurement period, but no evidence of the screening completed.
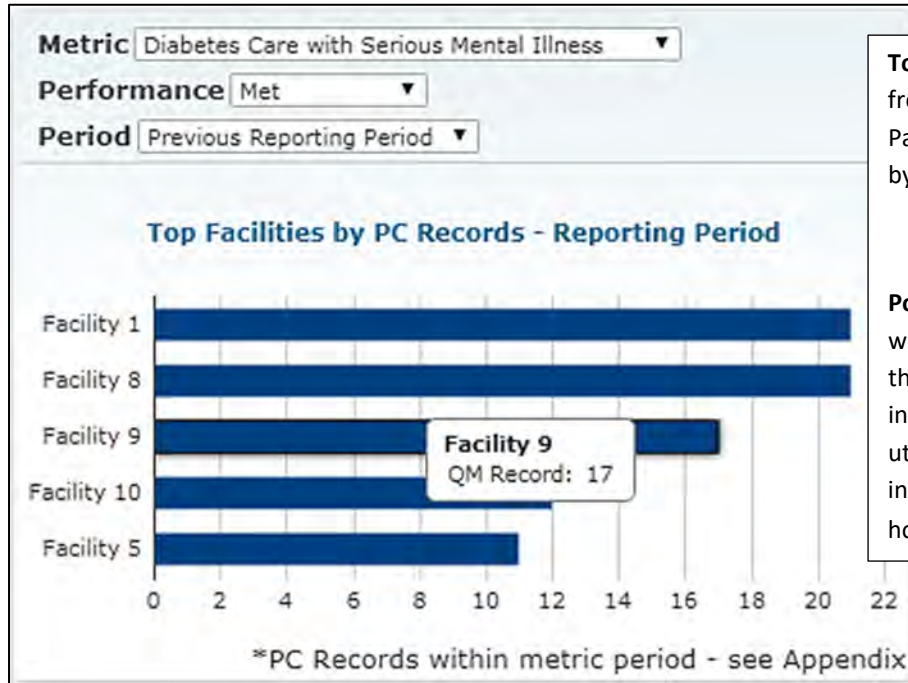

Unreported - The patient meets requirements for the metric, but does **not** have the required office visit.

Period identifies the reported timeframe.

Current - This is the current calendar year.

Previous - This is the previous calendar year.

Historical - This is anything prior to the 'Previous Reporting Period' time frame
